

# Linux Zima Client – Two Technical Points

## 1. Zerotier Integration and Control

- a. Zerotier must be packaged together with the Electron project into the installation package.
- b. The application needs to have full control over Zerotier's lifecycle (start, stop, upgrade, etc.).
- c. The application interface should allow managing Zerotier networks (for example, join or leave networks).

## 2. “Places” Area Pinning in File Manager

- a. The user should be able to pin an SMB share to the “Places” area in the top-left corner of the file manager via a button in the interface, for easy access.
- b. Similarly, it should support unpinning from the “Places” area (removing the SMB share shortcut) through a button.

We truly appreciate your support and contributions. Once the development is ready, we'd be very happy to test it together with you and help polish the final experience.
